HEMP SEED CATALOGUE

EU REGISTERED VARIETIES

Hempoint offers a wide range of certified European planting seed varieties in cooperation with European breeders.

All varieties in this catalogue are listed in the European Plant Variety Database.

Established in 2010, Hempoint has been distributing planting seed to farmers for over seven years.

CEO, Hana Gabrielova, has created an international network of partners to provide quality seeds that farmers can trust.

The Hempoint network extends to over 50 countries and has completed consulting projects and freight shipping to thirty countries globally.

CONNECTING THE DOTS

French variety	
Earlina 8FC	Earlina 8FC is bred for seed production and is one of the earliest grain varieties to mature. Large yields of seed can be expected with over 30% oil and 25% protein, along with moderate levels of CBD. Best suited for climates with lower levels of humidity and shorter growing zones.
Fédora 17	One of the favorites among Central European growers, this variety is successfully grown across the entire European Union, mainly for the production of grain to produce hemp oil but also for flowers; Fedora 17's flowers can reach high levels of cannabinoids for CBD production compared to other European varieties, which can reach only 5% maximum. Fast growing with good acclimatization properties.
Félina 32	One of the most cultivated varieties of hemp in the European Union, Felina 32's popularity is based on its tall stalks, and higher than average production of flowers that hold higher CBD content relative to other European hemp strains. Selected phenotypes of Felina 32 have been proven for the production of legal CBD blossoms in Switzerland. Felina 32 has great potential to produce branches if planted densely. Performs best in continental or oceanic climates.
Férimon	While Ferimon best expresses its characteristics in northern latitudes where it can give high seed yield and produce significant fibre, it has also shown adaptability in central and southern Europe. Ferimon grain is widely used in agri-food and cosmetics applications.
Fibror 79	A new variety that's bred exclusively for its rich fibre content, it can be grown in any geographical location, including areas with high heat, humidity and rainfall. The plant's genetics show a yellow stem that is long and straight, along with yellow-green leaves as the plants mature.
Futura 75	One of the oldest and well-known strains across Europe, Futura 75 is popular for many applications and gaining popularity in America. Able to acclimate to both northern and southern climates, northern climates see larger yields of fibre content. Southern zones can extend growing cycles, resulting in fair seed yield and flowers with elevated levels of CBD.
Futura 83	A new variety introduced in 2021, Futura 83 has a late-flowering cycle that makes it ideal for biomass production. The plant finds its home in southern latitudes where higher levels of humidity are found. Futura 83 brings heavy fibre yields with long straight stalks.
Santhica 27	Designed to produce large amounts of hemp fibre, the flowers from Santhica 27 also express significant levels of CBG and extremely low THC. This variety grows best in areas where humidity levels are on the higher side. Santhica 27 is not commonly harvested for seeds, so humidity levels conducive to seed growth are unnecessary. While generally recommended for northern Europe, Santhica 27 has also been successfully cultivated in northern Spain.
Santhica 70	Santhica 70 expresses relatively high levels of more stable CBG, and extremely low THC. This variety grows best in areas where humidity levels are on the higher side. This variety is not commonly harvested for seeds, so humidity levels conducive to seed growth are unnecessary.
USO 31	A variety widely in use in Europe, USO 31 is a good compromise between an early seed harvest and a crop with high fibre content. Well proven for its versatility and adaptability, this seed grows well in temperate zones of the Mediterranean as well as in Central Eastern Europe. Very low in phytocannabinoids content. (*also available in organic option).

Hungarian variety

Tiborszallási

If sown exclusively for fibre, the average height of Tiborszallasi can reach 2.5-3 meters. Tiborszallasi grows best in well-drained fields but for best seed yield, this variety needs lots of water and higher than average temperatures late in the growing cycle.

Kompolti

Kompolti is the oldest registered variety in Europe and is one of the latest maturing varieties. It is a very good fibre producing variety and can produce some of the most CBD of all registered industrial hemp varieties. Kompolti is traditionally multiplied in small amounts due to low seed yield.

Romanian variety

Secuieni Jubileu

This strain is best grown in continental climates, which is where it was developed and where it best adapts to the weather, giving it the best possible chance of success. If you're growing in Spain, we recommend staying on the mainland and away from the coast.

Zenit

This Romanian variety is for seed production. Monoecious free pollinating variety with medium maturity The oil content in this seed is particularly high at just above 30%.

Polish variety

Henola

The grain/oil variety, which is characterized by a grain yield higher than other varieties available on the market, short height of plants – up to about 2m, and a vegetation period shorter by 3 weeks as compared to Bialobrzeskie. Henola seed contains a very favorable ratio of fatty acids.

Bialobrzeskie

Bialobrzeskie is characterized by a high yield of seeds, and abundant high quality fibres. A stabilized variety that has primarily been grown for textile purposes since the 1960s.

Tygra

Tygra is characterized by a high yield of good quality fibre, used especially for technical purposes. It also yields a seed yield over 1 tone per hectare. A stable variety with a relatively short vegetation period.

Rajan

Rajan is characterized by high biomass production. The latest variety among those developed at the Institute. In Polish conditions reaches biological maturity at the end of September/at the beginning of October.

Finnish variety

Finola

Finola produces abundant grain in a short, auto-flowering and early maturing crop. FINOLA grows best in continental and temperate regions. It was the first industrial oilseed hemp variety to be registered in Canada and the EU. SOLD IN EUROPE ONLY.

Farming data

On following page is some farming data we have collected over the years, we hope it helps you with your choice!

This data is gathered from online information sources, breeders and other free available sources. They have purely informational character and final plant values may differ. We are therefore not responsible or liable for different content of cannabinoids or crop yield.

In case of any missing information or further questions, feel free to contact us.

Before you decide, here are some suggestions ...

If you are not sure which variety to choose, or how much of it for cultivation you will need.

The following 3 rules that may help you:

1. Be sure the varieties will grow in the region, connect with other growers or networks to find out what will work.
2. If hemp is new to the region, start small, select several varieties and conduct trials. Start small.
3. If the operation is new to farming hemp, keep in mind that to manage all the processes from field to final product could (and probably will) cost a lot of time and money.

Buy the right amount of hemp seeds based on the purpose of your grow.

We do recommend:

- 25-35 kg/ ha for seeds production
- 45 kg/ha for duo crop seeds and fibre production
- 40-60 kg/ha for fibre production

Selling conditions

Hemp seeds distribution in Europe is highly regulated by national government agencies. For this reason any reproduction by multiplication of the certified commercial seed sold by HEMPOINT is strictly prohibited. If you are interested in breeding or multiplication, inquire with us.

Reselling of hemp seeds sold by HEMPOINT is prohibited without a valid hemp seeds distributor license. If you planing to do that, we require you to submit for its review and approval your licence with your order of the seeds.

Before placing the order please check your local conditions to grow and import hemp seeds to your country.
